[57] ABSTRACT

An envelope being formed by overlying sheets peripherally attached to form a material holding pocket. An extension of one sheet serves as a flap and includes a crease formed therein to establish a bias characteristic in the creased material which encourages self-closure of the flap. The flap includes a second crease formed therein which enables an outwardly extending flap section to be tucked in and form a seal for the pocket entrance. Fastener means are provided to retain the flap and sealing strip in a closed position. The envelope is fabricated from a clear plastic material and allows the insertion of a data form therein. This allows one to removably imprint indicia on the surface of the envelope in columns and rows prescribed by the data form.
